

Project #4 - Self Evaluation

For me, the hardest part of this project was identifying the tasks to perform during my usability test, and especially the criteria statements used for each task. Effectively describing each task through those five metrics was particularly difficult, especially since I didn't want the questions to be biasing, and they needed to target that specific metric.

Beyond that challenge, I did find the usability study very informative on a more methodical way of evaluating a product's or two products' usability; something everyone does but in a significantly less direct way.

Once again, using Screencast-o-Matic was very easy to use, and made the whole process of creating a screencast a breeze. I struggled with my screencast script for this one, more than any other instances, particularly because demonstrating the task while reading from the script felt unnatural and I either messed up a lot, or sounded very formal.
